

## PROPERTIES

The product is formulated with resins dissolved in solvents so as to meet the need for a special protective coating that is easy to apply, long-lasting, and that can be used even on ornamental objects.

In fact, the **Syneco PROTEX PEEL** film coating, once applied, proves to be extremely thin and firm, so it can be used to protect objects made of silver, copper, brass, etc. from oxidation and color alteration during storage. The film coating can be easily removed by hand when the object is to be used. The protective coating that forms once the product is dry is firm, flexible, and can be removed by simply peeling it off or, in case the object the product has been applied to has a complex shape, by using a solvent.

## USE

The product is made to protect airtight electrical connectors used in high-humidity environments.

It can be applied by spray, brush, or immersion on tools, metal sheets, and finished or semi-finished products. It rapidly forms a thin, adhesive, and flexible coating that is completely dry in 60 seconds.

Before applying the product, all surfaces that are to be treated must be degreased, clean, and dry.
